

Claims

1. A sealing device comprising:

an annular member disposed in an annular hole, movable in an axial direction, and including a radial section and an axial section extending in the axial direction from at least one of an inner end and an outer end of the radial section, and

a sealing body including a sealing lip disposed over the radial section and the axial section of the annular member and hermetically abutting on a periphery of the annular hole,

the sealing device sealing one side and the other side of the annular member in the axial direction, wherein:

a stepped section with thinner wall is provided to the axial section adjacent to a root of the sealing lip; and

an end section of the sealing body is disposed to the stepped section.
